ubject Index for Volume 9 will appear in the December issue as part of a cumulative index for the year 1974.

Information for Authors

e *Journal of Solid State Chemistry* publishes manuscripts on chemical, structural, thermodynamic, electronic, magnetic and al properties and processes in solids. Typical studies encompass crystal chemistry, phase equilibria and transformations, –disorder phenomena, diffusion, high-temperature and high-pressure processes, crystal growth mechanisms, epitaxy, ing in solids, reactions at surfaces, statistical mechanics of defect interactions. Both theoretical and experimental papers elcome. On occasion a critical review is sought in selected rapidly developing fields.

glish, French, and German are the official languages of the Journal. Papers in Russian are acceptable, but they will be lated into English before publication.

anuscripts may be submitted to any one of the three editors (R. E. Hughes, Department of Chemistry, Cornell University, a, NY 14850; M. J. Sienko, Department of Chemistry, Cornell University, Ithaca, NY 14850; A. Wold, Division of neering, Brown University, Providence, RI 02912) or through any member of the Editorial Advisory Board.

anuscripts should be submitted in triplicate—double-spaced on one side of 21.5 × 28 cm paper. Headings of major sections ld be typed in capital letters and centered on the page.

ch page of the manuscript should be numbered. The first page should contain the article title, author's name, and ation. At the bottom of this page should appear any footnotes to the title (indicated by superscript *, †). The second page ld contain an abstract (50–150 words) which should be suitable for use in *Chemical Abstracts*.

e American Chemical Society's *Handbook for Authors* should be followed regarding matters of style and abbreviations of . The *Style Manual* of the American Institute of Physics is also an acceptable guide.

bles. Tables should be numbered with Roman numerals in a sequence corresponding to the order of citation in the text. es larger than two manuscript pages will be reproduced by photoengraving; therefore, all extended tables should be ared carefully in clear sharp type. Errors in such tables cannot be corrected in proof. Whenever appropriate, the tables ld be designed to fit the Journal page after photoreduction. Glossy prints of these extended tables are desirable. Footnotes bles are to be placed directly below the table and should be indicated by superscript, lower-case italic letters ($^{a, b, c}$).

ecial Tables. In lieu of publication, it may be necessary to deposit unusually long tables with the National Auxiliary ications Service (NAPS). In particular, structure factor tables must be deposited if, in a clear, proportioned, photoreduced at, they would occupy more than one Journal page (this corresponds to a limit of about 1000 F_o and F_c). In any case, copies of all tables must be submitted with the manuscript.

r material to be deposited, a deposit fee of $15.00 for up to 98 pages of standard-size or 48 pages of oversize deposited rial is to be paid by the authors to NAPS. Appropriate transmittal forms to accompany deposited material will be lied to the authors by the editors at the time a paper is accepted for publication.

e following footnote (wherein missing numbers are to be inserted by the author in page proof) should be used to ence deposited material:

"See NAPS document No. ..... for ..... pages of supplementary material. Order from ASIS/NAPS, Microfiche Publications, 305 E. 46th St., New York, N.Y. 10017. Remit in advance for each NAPS accession number) for microfiche or $5.00 for photocopies up to 30 pages, 15¢ for each additional page. Make checks payable to ofiche Publications."

gures. Authors should send glossy prints or original black ink drawings, no larger than 21.5 × 28 cm. It is important that ings be lettered with a lettering set and planned to fit the proportion of the printed page (14 × 20 cm). Background grids ld not be included. The caption of each axis should be lettered parallel to its axis. Lettering on the original should be enough to be legible after a reduction of 50%. For half-tone reproductions, glossy, high-contrast, black and white prints ld be submitted. Each figure should be identified in a margin with the author's name and figure number. Figures are to be in text by consecutive Arabic numerals. Figure captions should be typed as a list on a separate page.

uations. Equations should be typewritten or clearly handwritten, with an Arabic number if necessary for reference placed rentheses to the right of the equation. Reference to equations should use the form "Eq. (3)."

otnotes. Footnotes to the text should be indicated by consecutive superscript numbers and listed on a separate page at the of the article.

ferences. References should be cited in text by consecutive underlined numbers in parentheses. The references must appear separate sheet, listed in numerical order—i.e., in accordance with order of citation in text. After the reference number, the or's initials, last name, journal name, volume, initial page number, and year (in parentheses) should be listed in that order. eviations for journal names should follow the style of *Chemical Abstracts' Service Source Index*. For book references, give uthor's name, name of book (in quotes), editor's name (if any), edition (if other than the first), chapter, or page number, sher's name, place, and year of publication.

oofs. Unfolioed page proofs will be sent to the author with reprint order forms. There is no page charge.

Preparative Methods in Solid State Chemistry

Edited by PAUL HAGENMÜLLER
University of Bordeaux, France

As techniques for studying the properties of materials become more numerous and varied, compounds must be prepared with more and more care and competence. This book will provide researchers with an invaluable handbook of the principal methods of preparation now used by solid state chemists and physicists. Not only does it describe in detail the most important techniques of solid state synthesis – including electrolytic reduction, epitaxial deposition, and oriented eutectics – it also discusses in depth their advantages and limitations.

Written by internationally known specialists on the solid state, the book emphasizes the various methods of preparing single crystals. It also describes the role of pressure in choosing a method of synthesis, including the effect of high pressure on crystal structures and the processes in solid state synthesis. Several chapters are devoted to compounds posing special preparative problems: e.g., ferrites, III-V compounds, fluorides, allotropic varieties of boron, chalcogenides, and transition metal carbides.
